> HE TITLE compound 2 was obtained by treatment of 2,6dihydroxypyromellitimide 1 with benzenesulphonyl chloride. Compound 2 was used as starting material for the synthesis of new dipyrimidine and dialkyl 2,5 -di [(alkoxycarbonyl) amino] terephthalate derivatives. The reaction of 2 with different amines was intensively investigated with respect to the probability of isomerization. ## Results and Discussion

As a part of our program aimed at developing the synthesis of new pyrimidine derivatives as potential pharmaceuticals and/or agrochemicals, we reported here the synthesis of new pyrimidine and dialkyl 2,5-di[(alkoxycarbonyl) amino] terephthalate derivatives. Thus, the reaction of pyromellitic dianhydride with hydroxylamine hydrochloride in pyridine gave the previously prepared 2,6 dihydroxypyromellitimide $1^{(22)}$. Treatment of 1 with benzene-sulphonyl chloride affored 2,6-diphenylsulphonyloxy-1H,3H,5H,7H-pyrrolo[3,4-f]isoindole-1,3,5,7tetrone (2) ${ }^{(23)}$ as shown in Scheme 1.

Scheme 1
Compound 2 was reacted with hydrazine hydrate giving a mixture of two isomers, namely 3,8-diaminopyrimidoquinazoline-2,4,7,9-tetrone (3a) and 3,7-diaminopyrimidoquinazoline-2,4,6,8-tetrone (4a) as indicated from TLC. Attempts to separate the two isomers using column chromatography and fractional crystallization were unsuccessful. The ${ }^{1} \mathrm{H}$-NMR spectrum of 3 a and 4 a confirms their assigned structures as shown in Fig. 1.

Fig. 1. The ${ }^{\mathbf{1}} \mathbf{H}$-NMR spectrum in (DMSO-d6) of the two isomeric structures 3a and 4a.
Refluxing of compound 2 with phenylhydrazine gave 3,8-dianilinopyri-midoquinazoline-2,4,7,9-tetrone (3b). When a mixture of compound 2 and hydroxylamine hydrochloride in pyridine was refluxed, 3,8-dihydroxypyrimidoquinazoline (3c) was obtained as the sole product as shown in Scheme 2.

The reaction of compound 2 with different aliphatic, aralkyl, aromatic and heterocyclic amines was intensively investigated with respect to the two competing processes going on, which leading to isomerization. So, when compound 2 was allowed to react with ethylamine and/or propylamine in acetic $\mathrm{acid} /$ sodium acetate, a mixture of two isomers; 3 d and 4 b and/or 3 e and 4 c was obtained, respectively indicated by monitoring the reaction mixture using TLC. Separation of any mixture of them using column chromatography was unsuccessful owing to their comparable $\mathrm{R}_{\mathrm{F}}$ values.

Using the fractional crystallization, 3d and 3e were separated in very pure state using hot acetic acid, both were found to be partially soluble, while $4 b$ and 4 c were completely soluble. Detection of the filtrate using TLC showed the presence of the two isomers in each case.

Structures $3 \mathrm{~d}, 3 \mathrm{e}$ and " $4 \mathrm{~b}, 4 \mathrm{c}$ in the reaction mixtures" were established by their spectral data ( $c f$. Experimental Part).

Monitoring the reaction of 2 with butylamine in refluxing acetic acid using TLC revealed the formation of the two isomers $3 f$ and $4 d$, which are of comparable $\mathrm{R}_{\mathrm{F}}$ values. All attempts to separate the two isomers using column chromatography, HPLC and fractional crystallization were unsuccessful.

Successively, we also investigated the behavior of compound 2 towards aralkylamines with respect to the probability of isomerization.

Refluxing of compound 2 with primary aralkylamine namely, benzylamine and/or 2-phenylethylamine in glacial acetic acid in presence of sodium acetate afforded only one product, 3 g and/or 3h , respectively as shown in Scheme 2.

Scheme 2

The formation of the two isomeric structures (a) and (b) in case of reaction of 2 with different amines is related to the simultaneous attack of the amine used at the two carbonyl groups in position 1 and 5 to give pyrimido[4,5-g]quinazoline derivatives (a) as shown in "mechanism 1" in Scheme 3, or attacking of the amine used at the two carbonyl groups in position 1 and 7 to give pyrimido[5,4g]quinazoline derivatives (b), according to "mechanism 2" in Scheme 3.

Mechanism 1

Mechanism 2

Scheme 3

Obviously, the chemoselectivity outcome of the reaction of aralkylamine with compound 2 to give only one product takes place through the cross-attack at the carbons C1 and C5 which seems to be connected with the relative stability between the two isomeric structures (a) and (b) in addition to the steric factor.

In conjunction with our current research with the action of amine on compound 2 , we studied the action of primary aromatic amines which have been found to be less basic than alkylamines and aralkylamines.

Due to the low solubility of compound 2 and the reaction mixture of the following reactions, compound 2 was refluxed in dimethylformamide with primary aromatic amine namely, aniline, p -anisidine, p -aminophenol, p -toluidine, p-bromoaniline and p-nitroaniline to give one product in each case assigned as 3,8-diaryl-1,6-dihydropyrimido[4,5-g]quinazoline-2,4,7,9(3H,8H)-tetrone 3i-n as shown in Scheme 2.

The configuration assigned to these proposed structures $3 \mathrm{i}-\mathrm{n}$ was based on their spectroscopic evidence. ${ }^{1} \mathrm{H}$ NMR confirmed the cross-attack of the used aromatic amine in which two identical aromatic protons appeared as a singlet (cf. Experimental Part).
${ }^{13} \mathrm{C}$ NMR (DMSO) of compound 3 k gave a convincing evidence to the crossattack of the aromatic amine in which nine different signals for nine different carbon atoms were observed as follows: 150.02, s, C-1; 115.39, d, C-2; 129.85, d, C-3; 113.68, s, C-4; 157.23, s, C-5; 163.11, s, C-6; 134.12, s, C-7; 126.50, s, C-8; 120.21, d, C-9.

In continuation of the previous study, also the action of some heterocyclic amines on compound 2 was investigated. When compound 2 was allowed to react with different heterocyclic amines namely, 2-aminopyridine, 4-aminopyridine, 2aminomethylpyridine, 2-amino-1,3,4-thiadiazole and/or 2-amino-1,3-thiazole in different media such as pyridine, acetic acid and/or DMF according to the solubility of the reaction mixture, 3,8 -disubstituted-pyrimido[4,5-g]quinazoline-$2,4,7,9$-tetrones 30 -s were afforded respectively as shown in Scheme 2. Elucidation of the chemical structures of compounds 30 -s were based on their spectroscopic data ( $c f$. Experimental Part).

Refluxing of compound 2 with urea in acetic acid/ sodium acetate for 3 h gave compound 5 as shown in Scheme 2. The reaction of 2 with urea may proceed via a nucleophilic attack of urea to undergo ring enlargement to yield the pyrimidoquiazoline derivative as intermediate through "Lossen rearrangement" which reacts with urea followed by extra cyclization giving compound 5 as shown in Scheme 4.

## Scheme 4

Boiling of compound 2 with alcohols such as methanol, ethanol, propanol, butanol, pentanol and/or isopropanol in presence of few drops of pyridine gave the corresponding dialkyl 2,5-di[(alkoxycarbonyl)amino]terephthalate derivatives 6a-f, respectively as shown in Scheme 5.

Scheme 5
Identification of the chemical structure of compounds 6a-f were based on their spectroscopic data ( $c f$. Experimental Part), in which the reaction was found to proceed under basic condition through cross-attack giving only the terephthalate derivative.

## Conclusions

In summary, the action of aliphatic amines, aralkyl amines, aromatic amines and heterocyclic amines on 2,6-diphenylsulphonyloxypyromellitimide 2 was studied. We found that; the probability of isomerization is related to the relative stability between the two produced isomeric structures. Mainly one isomeric product takes place through the cross-attack at the carbonyl groups in position 1 and 5 of compound 2 , which seems to be more stable than the other isomer produced through the other attacking of the amine used at the position 1 and 7 of compound 2.

## Experimental

Melting points (uncorrected) were recorded on an Electrothermal melting apparatus. The IR spectra ( KBr ) were recorded on a Shimadzu 408 spectrometer. The ${ }^{1} \mathrm{H}$ NMR spectra were recorded by 400 MHz Varian EM 390 spectrometer. The ${ }^{13} \mathrm{C}$ NMR spectra were measured on Avance 600 spectrometer; Chemical shifts are reported in ppm with TMS as an internal standard and are given in $\delta$ units. Electron impact mass spectra were obtained at 70 eV using a GCMS sp. 1000 Shimadzu. Elemental analyses and ${ }^{13} \mathrm{C}$ NMR spectra were carried out at Regensburg University.

Synthesis of 3,8-Diaryl-1,6-dihydropyrimido[4,5-g]quinazoline-2,4,7,9(3H,8H)tetrone 3(i-n).

General procedure
A mixture of compound $2(0.6 \mathrm{~g}, 1 \mathrm{mmol})$ and primary aromatic amine, namely, aniline, $p$-anisidine, $p$-aminophenol, $p$-toluidine, $p$-bromoaniline and $p$ nitroaniline ( 4.0 mmol ) in DMF ( 15 ml ) was heated under reflux for 2-5 hr. After cooling, the solid crystals was filtered off, washed with water and recrystallized from appropriate solvent to give 3i-n.

فى هذا البحث نم تحضبر مركب 6،2- ثنائى فنبل سلفونبلوكسى- بيرولو
أيزواندولـ تترون واستخدم كمکب بداية لتحضبر بعض المركبات الغير متجانسة
الحققة الجديدة لمشتقات الثنائى بيريميدين بتفاعله مع الامينات المختلفة. كذلك
بتفاعله مع الكحولات المختلفة تم تحضبر مشتقات جديدة من الثنائى ألكيل
    تيريفثالا. وتم دراسة تأثبر الثباتية النسبية من ناحية تكون الايزوميرات.
