#### Abstract

A new series of )2-amino-4-(substituted)-4,10-dihydrobenzo[b]pyrano[2,3-e][1,4]thiazine-3-carbonitrile( 3(a, b) was synthesized by the reaction of 2 -(substituted) malononitrile with 2 H -benzo $[\mathrm{b}][1,4]$ thiazin $-3(4 \mathrm{H})$-one as a key starting material, )2-amino-4-(substituted)-4,10-dihydrobenzo[b]pyrano[2,3-e][1,4]thiazine-3-carbonitrile( $3(\mathrm{a}, \mathrm{b}$ ) reacted with some reagents, namely, formic acid, sulphuric acid, thiosemicarbazide, ethyl acetoacetate, triethyl orthoformate, carbon disulphide, diethylmalonate, malononitrile, phosphoryl chloride , and acetic anhydride to produce compounds $4(\mathrm{a}, \mathrm{b}), 5(\mathrm{a}, \mathrm{b}), 6(\mathrm{a}, \mathrm{b}), 8(\mathrm{a}, \mathrm{b})$, $9(\mathrm{a}, \mathrm{b}), 10(\mathrm{a}, \mathrm{b}), 11(\mathrm{a}, \mathrm{b}), 14(\mathrm{a}, \mathrm{b}), 15(\mathrm{a}, \mathrm{b})$, and $18(\mathrm{a}, \mathrm{b})$ some of newly synthesized compounds were studied and screened for their in vitro anticancer activity. Moreover, molecular dynamics simulation and target identification studies were conducted to support the findings .All the newly synthesized compounds were structurally confirmed by various modern analytical methods (IR, 1 H NMR and MS).

Keywords: pyrano thiazine. VEGFR-2 ,Anticancer, molecular dynamics simulation.

## 1. Introduction

New heterocyclic compounds have been a topic of great interest in the last few decades. This is because it has a wide range of applications. Heterocycles are essential to life and are very common in nature. Due to their pharmacological activity, 4H-pyran and its derivatives are of great interest[1] because they possess antispasmodic, anticoagulant, diuretic, anticancer, and antianaphylactic activities[2-4]. In addition, (4H-pyran) determine as a useful intermediate for synthesizing of various compounds such as pyranopyridine derivatives[5], polyazanaphthalenes [6] , pyranopyrimidines [7] , and pyridin-2-ones[8] . . Cancer is considered to be the leading cause of death in economically developed countries and is due to abnormal cell proliferation [9,

10] . In addition, protein kinases are involved in most signaling pathways leading to cancer cell proliferation and angiogenesis, including solid tumor growth. Colon, breast, gastric, and prostate cancers [11-13] VEGFR-2 (Vascular Endothelial Growth Factor Receptor 2) is a receptor tyrosine kinase [14], and its activation contributes may lead to increased tumor oxygenation [15, 16] . VEGFR-2 is most highly expressed in many cancers such as breast, hepatocellular and renal carcinomas [17-19] . As a result, inhibition of the VEGFR-2 signaling pathway is a very important property for anti-tumor therapy[20] . In this study, we investigated the anticancer activity of six synthetic compounds $3 \mathrm{a}, 4(\mathrm{a}, \mathrm{b}), 9(\mathrm{a}, \mathrm{b}), 18 \mathrm{~b}$ against different human cancer cell lines.

## 2. Experimental Section

### 2.1. Chemistry

All melting points are uncorrected and were taken in open capillary tubes using Electrothermal apparatus 9100. Elemental microanalyses were carried out at Microanalytical Unit, Central Services Laboratory, National Research Centre, Dokki, Cairo, Egypt, using VarioElementar and were found within $\pm 0.4 \%$ of the theoretical values. Infrared spectra were recorded on FT/IR- 4100 Jasco-Japan, Fourier transform, Infrared spectrometer at $\mathrm{cm}-1$ scale using KBr disc technique at Central Services Laboratory, National Research Centre, Dokki, Cairo, Egypt. 1H NMR and ${ }^{13} \mathrm{C}$ NMR spectra were determined by using a JEOL AS-500 NMR spectrometer at Central Services Laboratory, National Research Centre, Dokki, Cairo, Egypt. Varian Gemini200-Oxford 300 MHz and Merury Plus-Oxford 400 MHz at Ministry of defense, Chemical Warfare Department, The Main Chemical Warfare Laboratories, Cairo, Egypt. Chemical shifts were expressed in $\delta$ (ppm) downfield from tetramethylsilane as an internal standard. The mass spectra were measured with a GC MSQp1000EX Shimadzu, Cairo University, Cairo, Egypt, and with a Finnigan MAT SSQ-7000 mass spectrometer at Central Services Laboratory, National Research Centre, Dokki, Cairo, Egypt. Follow up of the reactions and checking the purity of the compounds were made by thin layer chromatography on silica gelprecoated aluminium sheets (Type 60, F 254, Merck, Darmstadt, Germany) using chloroform/methanol (20:2, v/v), and the spots were detected by exposure to UV lamp at $\lambda 254$ nanometer for few seconds and by iodine vapor.

> 2.1.1. 2-amino-4-(substituted)-4,10 dihydrobenzo [b] pyrano [2,3-e] [1,4] thiazine-3-arbonitrile 3(a,b)
( 0.01 mol ) of arylidenemalononitrles $\mathbf{1 a}, \mathbf{b}$ and benzothiazine $2(0.01 \mathrm{~mol})$ in methanol ( 25 ml ) containing piperidine ( 3 ml ) was refluxed for 8 h . After cooling the reaction mixture was filtered, dried and recrystallized [21].

[^1]Yield: $80 \%$; M.p. $120-122^{\circ} \mathrm{C}$. IR spectrum ( $\mathrm{KBr}, \mathrm{v}$, $\mathrm{cm}-1): 3415,3317,3191\left(\mathrm{NH}_{2} \& \mathrm{NH}\right), 3019(\mathrm{CH}$ aromatic), $2219(\mathrm{C} \equiv \mathrm{N}), 1679(\mathrm{C}=\mathrm{N}), 1158(\mathrm{C}=\mathrm{S}) .{ }^{1} \mathrm{H}-$ NMR ( 300 MHz, DMSO- $d_{6}$ ): 10.53 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{D}_{2} \mathrm{O}-$ exchangeable, NH ), $9.77\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{D}_{2} \mathrm{O}\right.$-exchangeable, $\mathrm{OH})$, 7.49-7.19 ((m, 7H, Ar-H),), 6.91 ( $\mathrm{s}, 2 \mathrm{H}, \mathrm{D}_{2} \mathrm{O}-$ exchangeable, $\mathrm{NH}_{2}$ ), 3.93
(s, $1 \mathrm{H}, \mathrm{CH}$ of pyran), $3.73\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right.$ ), . $\mathrm{MS}: \mathrm{m} / \mathrm{z}=$ 365.41. Anal. Calcd. ### 2.2. Biology:

### 2.2.1. Kinase assay

Via radiometric assay Inhibition of CDKs was evaluated using the Millipore Kinase Profiler services. Half-maximal inhibition $\left(\mathrm{IC}_{50}\right)$ values were calculated from 10-point dose-response curves and apparent inhibition constants (Ki) were calculated from the $\mathrm{IC}_{50}$ values and appropriate km (ATP) values for the kinases in question

### 2.2.1.1. VEGFR-2 kinase activity assays by ELISA

As a substrate, the assay performed in 96-well plates pre-coated with $20 \mu \mathrm{~g} \mathrm{ml}-1$ poly (Glu, Tyr) $4: 1$. In each well, $85 \mu \mathrm{l}$ of an $8 \mu \mathrm{M}$ ATP solution and $10 \mu \mathrm{l}$ of the compounds added at varying concentration. Using Sorafenib as a positive control, and $0.1 \%$ ( $\mathrm{v} / \mathrm{v}$ ) DMSO was the negative control. Experiments at each concentrations were performed in triplicate. The reaction initiated by adding $5 \mu \mathrm{l}$ of VEGFR-2 kinase. After incubation for 1 h at $37{ }^{\circ} \mathrm{C}$, the plate washed 3 times with PBS containing $0.1 \%$ Tween 20 (T-PBS). Next, $100 \quad \mu \mathrm{l}$ of antiphosphotyrosine (PY99; 1:500 dilution) antibody was added. After 1 h of incubation at room temperature, the plate washed 3times. Goat anti-mouse IgG horseradish peroxidase ( $100 \mu \mathrm{l} ; 1: 2000$ dilution) diluted in T-PBS containing $5 \mathrm{mg} \mathrm{ml}-1 \mathrm{BSA}$ was added. The plate Re-incubation at room temperature for 1 hour, and washed as before. At the end, $100 \mu \mathrm{l}$ of developing solution $\left(0.03 \% \quad \mathrm{H}_{2} \mathrm{O}_{2}, 2 \mathrm{mg} \mathrm{ml}-1 \mathrm{o}-\right.$ phenylenediamine in citrate buffer $0.1 \mathrm{M}, \mathrm{pH} 5.5$ ) added and incubated at room temperature until color emerged. The reaction was terminated by the addition of $100 \mu \mathrm{l}$ of $2 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$, and $\mathrm{A}_{492}$ was measured using a multiwell spectrophotometer (VERSAmax ${ }^{\mathrm{TM}}$ ) [26]. The inhibition rate (\%) was calculated using the equation:
Inhibition rate $(\%)=\left[1-\left(\mathrm{A}_{492} / \mathrm{A}_{492}\right.\right.$ control $\left.)\right] \times 100 \%$.

### 2.2.2. MTT toxicity assays

The cytotoxicity of the newly synthesized compounds against cancer cell lines in vitro performed with the MTT assay according to the Mosmann's method. The MTT assay is based on the reduction of the soluble 3-(4,5-methyl-2-thiazolyl)-2,5-diphenyl- 2 H -tetrazolium bromide (MTT) into a
blue-purple formazan product, mainly by mitochondrial reductase activity inside living cells.
The cells used in cytotoxicity assay were cultured in RPMI 1640 medium supplemented with $10 \%$ fetal calf serum. Cells suspended in the medium ( $2 \times 10^{4} \mathrm{~mL}$ ) were plated in 96 -well culture plates and incubated at $37{ }^{\circ} \mathrm{C}$ in a $5 \% \mathrm{CO}_{2}$ incubator. After 12 hours, the test sample ( $2 \mu \mathrm{~L}$ ) was added to the cells ( $2 \times 10^{4}$ ) in 96well plates and cultured at $37{ }^{\circ} \mathrm{C}$ for 3 days. The cultured cells were mixed with $20 \mu \mathrm{~L}$ of MTT solution and incubated for 4 hours at $37^{\circ} \mathrm{C}$.crystals which were formed by the cellular reduction of MTT. After mixing with a mechanical plate mixer, the absorbance of each well was measured by a microplate reader using a test wavelength of 570 nm .
The results were expressed as the $\mathrm{IC}_{50}$, which induced a $50 \%$ inhibition of treated cell growth when compared to the growth of control cells. Each experiment was performed at least 3 times.
There was a good reproducibility between replicate wells with standard errors below $10 \%$.

### 2.3. Molecular dynamics simulation and target identification

### 2.3.1. System preparation

The crystal structure of the human CDK-activating kinase (CAK) , and Vascular endothelial growth factor receptor 2 (VEGFR2s) were retrieved from the protein data bank with codes6XD3, and 4ASD, respectively [27, 28]. These compounds were then prepared for the molecular dynamics (MD) studies by using UCSF Chimera [29]. Using PROPKA, pH was fixed and optimized to 7.5[30]. Compound (14b) was drawn by ChemBioDraw Ultra 12.1[31]. Altogether, as described in the simulation section, the two prepared systems were subjected to 20 ns MD simulations.

### 2.3.1.1. Molecular dynamics (MD) simulations

Integration of Molecular dynamics (MD) simulations in biological systems' study enable exploring the physical motion of molecules and atoms that cannot be easily accessed by any other means[32].The insight extracted from performing this simulation provides an intricate perspective into the biological systems' dynamical evolution, such as conformational changes and molecule association [32] .The Molecular dynamics (MD) simulations of all systems were performed by using the GPU version of
the PMEMD engine present in the AMBER 18 package[33].
The partial atomic charge of each compound calculated with ANTECHAMBER's General Amber Force Field (GAFF) technique[34]. The Leap module of the AMBER 18 package implicitly solvated each system within an orthorhombic box of TIP3P water molecules within $10 \AA$ of any box edge. The Leap module was used to neutralize each system by incorporating $\mathrm{Na}+$ and $\mathrm{Cl}-$ counter ions. A 2000-step initial minimization of each system was carried out in the presence of a $500 \mathrm{kcal} / \mathrm{mol}$ applied restraint potential, followed by a 1000 -step full minimization using the conjugate gradient algorithm without restraints.

During the Molecular dynamics (MD) simulation, each system was gradually heated from 0 K to 300 K over 500 ps , ensuring that all systems had the same amount of atoms and volume. (The system's solutes were subjected to a $10 \mathrm{kcal} / \mathrm{mol}$ potential harmonic constraint and a 1 ps collision frequency). Following that, each system was heated and equilibrated for 500 ps at a constant temperature of 300 K . To simulate an isobaric-isothermal (NPT) ensemble, the number of atoms and pressure within each system for each production simulation were kept constant, the Berendsen barostat used with the system's pressure maintained at 1 bar [35].
For 20 ns , each system was Molecular dynamics (MD) simulated. The SHAKE method used to constrain the hydrogen bond atoms in each simulation. Each
simulation used a 2fs step size and integrated an SPFP precision model. An isobaric-isothermal ensemble (NPT) with randomised seeding, constant pressure of 1 bar, a pressure-coupling constant of 2 ps , a temperature of 300 K , and a Langevin thermostat with a collision frequency of 1 ps was used in the simulations.

### 2.3.1.2. Post-MD Analysis

After saving the trajectories obtained by Molecular dynamics (MD) simulations every 1 ps , the trajectories analyzed using the AMBER18 suite's CPPTRAJ [36] module. to create all graphs and visualizations, The Origin [37] data analysis program and Chimera [29] were used.

### 2.3.1.3. Thermodynamic calculation

The Poisson-Boltzmann or generalized Born and surface area continuum solvation (MM/PBSA and MM/GBSA) approach has been found to be useful in estimation of ligand-binding affinities [38-40] . The Protein-Ligand complex molecular simulations used by MM/GBSA and MM/PBSA compute rigorous statistical-mechanical binding free energy within a defined force field.
Binding free energy averaged over 500 snapshots extracted from the entire 50 ns trajectory. The estimation of the change in binding free energy ( $\Delta \mathrm{G}$ ) for each molecular species (complex, ligand, and receptor) can be represented as follows[41] :

$$
\begin{align*}
& \Delta \mathrm{G}_{\text {bind }}=\mathrm{G}_{\text {complex }}-\mathrm{G}_{\text {receptor }}-\mathrm{G}_{\text {ligand }}  \tag{1}\\
& \Delta \mathrm{G}_{\text {bind }}=\mathrm{E}_{\text {gas }}+\mathrm{G}_{\text {sol }}-T S  \tag{2}\\
& \mathrm{E}_{\text {gas }}=\mathrm{E}_{\text {int }}+\mathrm{E}_{\text {vdw }}+\mathrm{E}_{\text {ele }}  \tag{3}\\
& \mathrm{G}_{\text {sol }}=\mathrm{G}_{\mathrm{GB}}+\mathrm{G}_{\text {SA }}  \tag{4}\\
& \mathrm{G}_{\text {SA }}=\gamma \mathrm{SASA} \tag{5}
\end{align*}
$$

The terms Egas, Eint, Eele, and Evdw symbolize the gas-phase energy, internal energy, Coulomb energy, and van der Waals energy. The Egas was directly assessed from the FF14SB force field terms. Solvation-free energy (Gsol) was evaluated from the energy involvement from the polar states (GGB) and non-polar states (G). The non-polar solvation free energy (GSA) was determined from the Solvent Accessible Surface Area (SASA) [42, 43] using a water probe radius of $1.4 \AA$. In contrast, solving the GB equation assessed the polar solvation (GGB)
contribution. Items S and T symbolize the total entropy of the solute and temperature, respectively.

## 3. Results and discussion

### 3.1. Chemistry

(2-amino-4-(substituted)-4,10-
dihydrobenzo[b]pyrano[2,3-e][1,4]thiazine-3-
carbonitrile) 3(a, b) synthesized as the reported method [11] , formic acid and sulphoric acid reacted with compounds $3(a, b)$ to give compounds $4(a, b)$ and $5(a, b)$ respectively, according to the method [11].
(Scheme 1). ${ }^{1} \mathrm{H}$ NMR for compound 4(a,b) confirmed the proposed structure due to the appearance of $\left(\mathrm{NH}_{2}\right)$. Treatment of the compounds 3(a, b) with concentrated thiosemicarbazide led to the formation of compound $6(a, b)$ according to the method [12]. (Scheme 1). Significant indication for the formation of compounds $6(a, b)$ provided by IR bands, Heating of ethyl acetoacetate in dimethyl formamide with compound $3(\mathbf{a}, \mathbf{b})$ in the presence of equimolar amount of potassium carbonate result in one spot on TLC, the result product was identified as 1-(4-amino-2-hydroxy-5-( substituted)-3,4,5,11tetrahydrobenzo[b]pyrido [3',2':5,6]pyrano[2,3-e][1,4]thiazin-3-yl)ethan-1-one $8(a, b)$ according to the method [12]. (Scheme 1). The formation of $\boldsymbol{8}(\boldsymbol{a}, \boldsymbol{b})$ was appeared to be proceeds via heterocyclization of the expected intermediate ( N -(4-(substituted)3-cyano-4,10-dihydro benzo[b]pyrano[2,3-e] [1,4] thiazin-2-yl)-3-oxobutanamide) 7(a,b) By Characteristic IR bands we proved the formation of compounds $8(a, b)$ , compounds $3(\mathrm{a}, \mathrm{b})$ When reacted with acetic anhydride in the presence of triethyl orthoformate , compounds $9(\mathrm{a}, \mathrm{b})$ are formed according to method [12]. (Scheme 2). ${ }^{1} \mathrm{H}$ NMR for compound 9(a,b) confirmed the proposed structure due to the disappearance of $\left(\mathrm{NH}_{2}\right)$ and appearance of $\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$ Also compound $10(\mathrm{a}, \mathrm{b})$ prepared by the reaction of compound $3(\mathrm{a}, \mathrm{b})$ with $\mathrm{CS}_{2}$ in the presence of alcoholic KOH in DMF according to the method [13]. (Scheme 2). ${ }^{1} \mathrm{H}$ NMR for compounds $10(\mathrm{a}, \mathrm{b})$ confirmed the proposed structure due to the disappearance of $\left(\mathrm{NH}_{2}\right)$ group.

Treatment of $3(\mathrm{a}, \mathrm{b})$ diethylmalonate and phosphoryl chloride in anhydrous DMF gave the corresponding derivatives $11(\mathrm{a}, \mathrm{b})$ and $14(\mathrm{a}, \mathrm{b})$ according to the method [14] . (Scheme 2).

Confirmation of the synthesized compounds $11(\mathrm{a}, \mathrm{b})$ and 14(a,b) was done using ${ }^{1} \mathrm{H}$ NMR spectroscopic data. For example disappearance of $\left(\mathrm{NH}_{2}\right)$ group.

When 3(a,b) briefly ( 10 min ) refluxing with acetic anhydride gave the monoacetyl derivatives $15(\mathrm{a}, \mathrm{b})$.; after reflux for a long time ( 10 h ) the cyclic intermediate 5 -(substituted-2-methyl-5,11-dihydro-4H-benzo[5',6'][1,4]thiazino[2',3':5,6]pyrano[2,3-d][1,3]oxazin-4-imine $16(a, b)$ was obtained, then rearrangement occurred to give intermediate $17(\mathrm{a}, \mathrm{b})$ followed by acetylation of the NH group to afford the N -(3-cyano-4-( substituted)-4,10-dihydrobenzo[b]pyrano[2,3-e][1,4]thiazin-2yl)acetamide $18(\mathrm{a}, \mathrm{b})$, according to the method [15]. (Scheme 2). The structure of compounds $15(\mathrm{a}, \mathrm{b})$ and 18(a,b) determined based on the basis of elemental analysis and spectral data. Thus, the IR spectrum of compound 18(a,b) showed disappearance of (CN)group.

### 3.1.1. CDK inhibiting properties

The anti-CDK activity of the newly synthesized compounds (Table1) was determined using the Millipore Kinase Profiler service [Y. Cheng, W.H. Prusoff, Relationship between inhibition constant (KI) and concentration of inhibitor causing 50 percent inhibition (I50) of the enzymatic reaction, [44]

All newly synthesized compounds selectively inhibited all CDKs in the low nanomolar range and exhibited higher inhibitory activity than flavopiridol. Compounds 3a, 10 (a,b), 9 (a,b), 18b showed higher inhibitory activity against CDK7H and recorded CDK7H.

Table 1. CDK inhibiting effect of tested compounds

| Compound | Kinase inhibition, Ki (nM) |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | CDK9T1 | CDK7H | CDK1B | CDK2E | CDK6D3 |
| 18 b | 0.11 | 0.05 | 1.11 | 2.33 | 0.55 |
| 10 a | 0.12 | 0.07 | 1.56 | 2.67 | 0.68 |
| 10 b | 0.15 | 0.09 | 1.77 | 3.56 | 0.78 |
| 9 a | 0.17 | 1.11 | 1.89 | 4.88 | 0.89 |
| 9 b | 0.21 | 1,15 | 2.11 | 6.18 | 0.91 |
| 3 a | 0.34 | 1.22 | 2.59 | 9.24 | 0.92 |
| Flavopiridol | 3 | 113 | 13 | 79 | 265 |

### 3.1.2. In vitro anti-VEGFR-2 screening

Studying anti-VEGFR-2 activity of the synthesized compounds (Table 2) showed compound (3a) as the Table 2. Anti-VEGFR-2 activity of the synthesized compounds

| Compound | Enzymatic inhibition (IC50/nM) |
| :--- | :--- |
|  | VEGFR-2 |
| 18 b | 0.055 |
| 10 a | 0.067 |
| 10 b | 0.069 |
| 9 a | 0.089 |
| 9 b | 0.094 |
| 3 a | 69 |
| vandetanib | 2 |
| Sorafenib |  |

### 3.1.3. In vitro anticancer activity

All target compounds were screened for anticancer activity against various 18 types of human cancer cell
lines using the MTT assay by the Mossman method [45]. (Tables 3a and 3b).

Table 3a. In vitro anticancer activity of tested compounds.

| Compound | IC50 (nM) |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

3.1.4. Molecular dynamics simulation and target identification
3.1.4.1. Molecular dynamics and system stability

Molecular dynamics simulation was used to predict the performance of the prepared compounds when binding to the active site of the protein, as well as its interaction and stability by simulation [46, 47] . System stability validation is essential to monitor
disturbed movements and avoid phenomena that may develop during simulation. This study evaluates the mean square deviation (RMSD) to measure the stability of the system during the simulation of 20 ns . This study evaluates the Root Mean Square Deviation (RMSD), which measures the stability of the system during the simulation of 20 ns . The mean RMSD values recorded for all frameworks of the apo-protein system and the 18b complex system for VEGFR2 were $1.85 \AA$ and 1.62 , respectively. (Fig. 1A).

Figure 1: [A] RMSD of $\mathrm{C} \alpha$ atoms of the protein backbone atoms. [B] RMSF of each residue of the protein backbone C $\alpha$ atoms [c] RoG of C $\alpha$ atoms of protein residues of the backbone atoms relative (black) to the starting minimized over 20 ns for the VEGFR2s protein with ligand 18 b (red).

Figure 2: [A] RMSD of $\mathrm{C} \alpha$ atoms of the protein backbone atoms. [B] RMSF of each residue of the protein backbone $\mathrm{C} \alpha$ atoms [c] RoG of $\mathrm{C} \alpha$ atoms of protein residues of the backbone atoms relative (blue) to the starting minimized over 20 ns for the CAK protein with ligand $18 \mathrm{~b}(\mathrm{Cyn})$.

While the average RMSD values recorded for all the frame works of the apo-protein system and the 18b complex system for CAK were $2.59 \AA$ and $2.07 \AA$, respectively. (Figure 2a). From these results, we reveal that the protein-bound 18b Complex systems adopt relatively more stable conformations than other systems studied in both targets .It is critical for examining residue behavior and their connection with the ligand to assessing protein structural flexibility upon ligand binding during MD simulation [48] . Using Root-Mean-Square Fluctuation (RMSF) algorithm Protein residues fluctuations evaluated to evaluate the effect of inhibitor binding aganist the respective targets above 20 ns simulations. Computed average RMSF values were $5.39 \AA$, and $1.02 \AA$ for apoprotein, and 14b-complex system for the VEGFR2s, respectively. While, The computed average RMSF values were $6.41 \AA$, and $6.14 \AA$ for apo-protein, and 18b-complex system for the CAK, respectively. In general residue fluctuations of individual systems are represented in Figure 1B, and 2b. Values revealed that the lower residue fluctuation than the other systems on both targets was 18 b -bound to protein complex system

The radius of gyration ( Rg ) is an indicator of protein structure rigor as well as stability during simulation. As shown in Figure 1C, the Rg values of apo-protein and complex with compound 18 b are $20.11 \AA$ and $19.88 \AA$ for VEGFR2. While the Rg values of apo-protein and complex with compound

18 b were $21.58 \AA$ and $21.40 \AA$ for CAK (Figure 2c). The Rg of the ligand-binding protein was found to have a stiffer structure than that of the Apo protein.

### 3.1.5. Binding interaction mechanism based on binding free energy calculation:

To determine the free binding energies of small molecules to biological macromolecules, the molecular mechanical energy technique (MM/GBSA) is a popular method, incorporating the general resolution of continuous generation and surface, and may be more reliable than the score [49]. To calculate the bound free energy by extracting the orbital snapshot of the system, the program MM-GBSA in AMBER18 was used. In (Table 4), all reported calculated energy components (except $\Delta$ Gsolv) have high negative values indicating favorable interactions. These results indicate that the binding affinity of 18 b binding to VEGFR2 and CAK is $-31.48 \mathrm{kcal} / \mathrm{mol}$, $37.08 \mathrm{kcal} / \mathrm{mol}$, respectively.
$\Delta$ Eele $=$ electrostatic energy; $\Delta \mathrm{EvdW}=$ van der Waals energy; $\Delta$ Gsolv = solvation free energy; $\Delta \mathrm{Gbind}=$ calculated total binding free energy.

The interaction between 18b and protein receptor residues VEGFR2 and CAK is driven by more active vander Waals energy components, as demonstrated by a detailed examination of each individual energy contribution, resulting in free energy. Reported link. (Table 4).

Table 4: The calculated energy binding for the 18 b compounds against the VEGFR2s, and CAK protein receptors.

| Energy Components (kcal/mol) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Complex | $\Delta \mathbf{E}_{\text {vdW }}$ | $\Delta \mathbf{E}_{\text {elec }}$ | $\Delta \mathbf{G}_{\text {gas }}$ | $\Delta \mathbf{G}_{\text {solv }}$ | $\Delta \mathbf{G}_{\text {bind }}$ |  |
| $\mathbf{1 8 b}-$ VEGFR2s | $-47.23 \pm 0.40$ | $-1.78 \pm 0.49$ | $-49.01 \pm 0.54$ | $17.53 \pm 0.32$ | $-31.48 \pm 0.43$ |  |
| $\mathbf{1 8 b}-$ CAK | $-45.06 \pm 0.52$ | $-23.59 \pm 1.10$ | $-68.66 \pm 1.13$ | $31.57 \pm 1.10$ | $-37.08 \pm 0.46$ |  |

$\Delta \mathrm{EvdW}=$ van der Waals energy; $\Delta \mathrm{Eele}=$ electrostatic energy; $\Delta \mathrm{Gsolv}=$ solvation free energy; $\Delta \mathrm{Gbind}=$ calculated total binding free energy

### 3.1.6. Identification of the critical residues responsible for ligands binding:

The total energy involved when 14b binds to these enzymes can be broken down into the involvement of individual site residues to gain more knowledge about
the key residues involved in the inhibition of VEGFR2 receptors. Connection of CAK receptor 18 b to is observed mainly from residues Ala 75 ( -0.161 $\mathrm{kcal} / \mathrm{mol})$, Leu $76(-0.389 \mathrm{kcal} / \mathrm{mol})$, Ser 78 ( -0.368 $\mathrm{kcal} / \mathrm{mol})$, Glu 79 ( $-1.133 \mathrm{kcal} / \mathrm{mol}$ ). , Leu 80 ( -0.253
$\mathrm{kcal} / \mathrm{mol}$ ), Ile 82 ( $-1.765 \mathrm{kcal} / \mathrm{mol}$ ), Leu 83 ( -2.80 $\mathrm{kcal} / \mathrm{mol})$, Ile $86(-0.787 \mathrm{kcal} / \mathrm{mol})$, Val $92(-0.437$ $\mathrm{kcal} / \mathrm{mol}$ ) mol ), Val 93 ( $-0.402 \mathrm{kcal} / \mathrm{mol}$ ), Val 108 ($0.651 \mathrm{kcal} / \mathrm{mol})$, Val $110(-0.793 \mathrm{kcal} / \mathrm{mol})$, Leu 156 $(-0.502 \mathrm{kcal} / \mathrm{mol})$, Cys $182(-2.086 \mathrm{kcal} / \mathrm{mol}) \mathrm{mol})$ $\mathrm{mol}) \mathrm{mol}$ ) , Asp 183 ( $-0.329 \mathrm{kcal} / \mathrm{mol}$ ), Phe 184 ($0.509 \mathrm{kcal} / \mathrm{mol}$ ). On the other hand, the major beneficial contributions of 18 b compounds to the CAK receptor are mainly at residues Leu $74(-0.876$ $\mathrm{kcal} / \mathrm{mol})$, Gly $75(-1.33 \mathrm{kcal} / \mathrm{mol})$ and Glu 76 ( -0.325 $\mathrm{kcal} / \mathrm{mol})$. It has been constructed. mol), Ala $80(-0.6$ $\mathrm{kcal} / \mathrm{mol})$, Val $82(-2.71 \mathrm{kcal} / \mathrm{mol})$, Ala 95 ( -0.614 $\mathrm{kcal} / \mathrm{mol})$, Lys 97 ( $-1.471 \mathrm{kcal} / \mathrm{mol}$ ), Glu 113 ( -0.406 $\mathrm{kcal} / \mathrm{mol}) \mathrm{mol})$, Phe $112(-0.919 \mathrm{kcal} / \mathrm{mol})$, Met 145 $(-1.126 \mathrm{kcal} / \mathrm{mol})$, Thr 147 ( $-0.284 \mathrm{kcal} / \mathrm{mol}$ ), Asn193 ( $-0.24 \mathrm{kcal} / \mathrm{mol}$ ), Leu 194 ( $-0.219 \mathrm{kcal} / \mathrm{mol}$ ) ), Leu $195(-2.104 \mathrm{kcal} / \mathrm{mol})$, Ala $205(-2.22 \mathrm{kcal} / \mathrm{mol})$, Asp $206(-1.119 \mathrm{kcal} / \mathrm{mol})$.

## 4. Conclusion

In summary, The purpose of the present work is the synthesis of new Pyrano[2,3-e][1,4]thiazine derivatives, which are projected to show potent anticancer activity. Thus, the parent Pyrano[2,3e][1,4]thiazine derivatives $3(\mathrm{a}, \mathrm{b})$ was subjected to a series of various reactions to get the target compounds. In vitro cytotoxic evaluation of all the novel Pyrano[2,3-e][1,4]thiazine derivatives against human cancer cell. Compounds $3 \mathrm{a}, 10(\mathrm{a}, \mathrm{b})$, $9(\mathrm{a}, \mathrm{b})$, 18 b showed higher inhibitory activity against CDK7H and recorded CDK7H. Studying anti-VEGFR-2 activity showed that compound (3a) as the most active compound $($ IC50 $=0.094 \mathrm{nM})$ and showing even a higher activity than the reference drug $(I C 50=2 n M)$.
